

**BACKEND  
DEVELOPMENT**

**FRONTEND  
DEVELOPMENT**

**BACKEND  
DEVELOPMENT**

# WHAT IS THIS

**Backend** is the part of a web application or website that runs on the server and is responsible for data processing, application logic, databases, servers and APIs.

**Web development** is the process of creating websites and web applications, which includes working with both the client (Frontend) and server (Backend) parts.

**Frontend** is the part of a website or web application that the user interacts with. This is everything that the user sees and works with in the browser.

# WHAT IS IT FOR?

## WEB DEVELOPMENT

Web development is needed to create websites and web applications that provide information, services or functionality to users over the Internet.

## FRONTED DEVELOPMENT

Frontend is needed to display and interact with a web page. This is the visual part of the site, which is responsible for the user interface and experience

## BACKEND DEVELOPMENT

The backend is needed to process requests from the user, perform business logic, work with databases and send the necessary data back to the frontend.

# HOW TO USE

About

Backend is used to create functionality that is hidden from the user: data management, working with the server, data storage, user authentication and much more

Frontend is developed using HTML for structure, CSS for styling and JavaScript for interactivity.

Used to create various websites, from simple one-page websites to complex applications with interactive functions
